

Amendments of the Claims:

A detailed listing of all claims in the application is presented below. This listing of claims will replace all prior versions, and listings, of claims in the application. All claims being currently amended are submitted with markings to indicate the changes that have been made relative to immediate prior version of the claims. The changes in any amended claim are being shown by ~~strikethrough~~ (for deleted matter) or underlined (for added matter).

7. (Currently Amended) A system to treat diseases based on biological activities, comprising:
 - a) at least one biological activity sensing means which senses biological activity information issued by biological activities, and outputs a plurality of biosignals;
 - b) a calculating means which receives the biosignals, calculates a plurality of signals for stimulation of an organism using a convolution integral between at least one impulse response previously obtained from normal biological activities and the biosignals, and outputs the signals for stimulation of the organism;
wherein the impulse response is calculated from an inverse Fourier transform of a transfer function which is based on a Fourier transform of the biosignals;
and

- c) an organism stimulating means which receives the signals for stimulation of the organism, and stimulates the organism based on those signals.

8. (Previously Presented) The system of claim 7, wherein the biological activity sensing means is selected from the group consisting of electrodes and pressure sensors.

9. (Previously Presented) The system of claim 7, wherein the biosignals are selected from the group consisting of sympathetic nerve activities, parasympathetic nerve activities, blood flow, blood pressure, body temperature, electrocardiogram, electroencephalogram, and various biochemical markers.

10. (Previously Presented) The system of claim 7, wherein the organism stimulating means stimulates in a manner selected from the group consisting of electrical stimulation; and stimulation with the use of devices for drug administration.

11. (Previously Presented) The system of claim 7, wherein the calculating means comprises:

- at least one amplifier to amplify the biosignal;
- at least one analog-to-digital converter, to convert the biosignal from an analog signal to a digital signal; and
- at least one analyzer to process data to calculate signals to be transferred to the organism stimulating means.

12. (Previously Presented) A system to treat diseases based on biological activities, comprising:

- a) at least one biological activity sensing means which senses biological activity information issued by biological activities, and outputs a plurality of biosignals;
- b) a calculating means which receives the biosignals, calculates a plurality of signals for stimulation of an organism using a convolution integral between an impulse response previously obtained from normal biological

activities and the biosignals, and outputs the signals for stimulation of the organism;

wherein the impulse response is calculated from an inverse Fourier transform of a transfer function which is based on a Fourier transform of the biosignals;
and

c) an organism stimulating means which receives the signals for stimulation of the organism calculated by the calculating means, and stimulates the organism based on those signals;

wherein the calculating means includes discriminating means which determine whether the biosignals are caused by normal biological activities or by abnormal biological activities;

wherein the calculating means does not output the signals for stimulation of the organism when the biosignals are determined to be caused by normal biological activities; and

wherein the calculating means outputs the signals for stimulation of the organism when the biosignals are determined to be caused by abnormal biological activities.
